Submission time: 2014-05-18 20:09:48 PST (GMT - 8:00)

Number of questions:25Positive points per question:4.0Negative points per question:0.0Your score:100

- 1. What is the concatenation of 011 and 1010?
 - a) 1010011
 - b) 0111010
 - c) 0001111
 - d) 011 1010

Answer submitted: b)

You have answered the question correctly.

2. Let L be the language of all strings of a's and b's such that no prefix (proper or not) has more b's than a's. Let G be the grammar with productions

```
S \rightarrow aS \mid aSbS \mid \epsilon
```

7b)

To prove that L = L(G), we need to show two things:

- 1. If S = > * w, then w is in L.
- 2. If w is in L, then S => * w.

We shall consider only the proof of (2) here. The proof is an induction on n, the length of w. Here is an outline of the proof, with reasons omitted. You need to supply the reasons.

1)	Basis:
1)	If n=0, then w is ϵ because
2)	S =>* w because Induction:
3) 4a)	Either (a) w can be written as w=aw' where for w' each prefix has as many a's as b's or (b) w car be written as w=aw'bw" where for both w' and w" hold that each prefix has as many a's as b's because
,	In case (a), w' is in the language because
5a) 5a)	In case (a), S =>* w' because
4b)	In case (a), $S \Rightarrow * w$ because
5b)	In case (b), both w' and w" are in the language because
5b)	In case (b), S =>* w' because
<i>,,</i>	In case (b), $S = * w''$ because

In case (b), S =>* w because _____

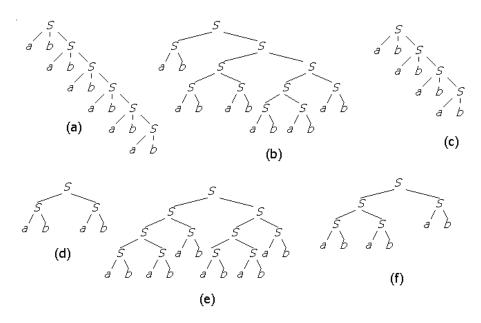

For which of the steps above is the appropriate reason "by the inductive hypothesis"?

- a) 2
- b) 4a
- c) 3
- d) 5a

Answer submitted: d)

You have answered the question correctly.

3. Which of the parse trees below yield the same word?

- a) b and e
- b) a and c
- c) c and f
- d) a and d

Answer submitted: a)

You have answered the question correctly.

- **4.** Consider the language $L=\{a\}$. Which grammar defines L?
 - a) $G_1:S \to AC|\epsilon, A \to b$
 - b) $G_1:S \to AC|a, A \to c|b|\epsilon$
 - c) $G_1:S \to AB|BC, A \to b, C \to a$
 - $d) \quad G_1{:}S \to AC|a|ab,\, A \to c|\epsilon$

Answer submitted: b)

You have answered the question correctly.

5. We wish to perform the reduction of acceptance by a Turing machine to MPCP, as described in Section 9.4.3 (p. 407). We assume the TM *M* satisfies Theorem 8.12 (p. 346): it never moves left from its initial position and never writes a blank. We know the following:

- 1. The start state of M is q.
- 2. r is the accepting state of M.
- 3. The tape symbols of *M* are 0, 1, and B (blank).
- 4. One of the moves of *M* is $\delta(q,0) = (p,1,L)$.

Which of the following is DEFINITELY NOT one of the pairs in the MPCP instance that we construct for the TM *M* and the input 001?

- a) (1, 1)
- b) (r1, r)
- c) (0r, r)
- d) (#, #q001)

Answer submitted: d)

You have answered the question correctly.

- **6.** The intersection of two CFL's need not be a CFL. Identify in the list below a pair of CFL's such that their intersection is not a CFL.
 - a) $L_1 = \{aba^nb^nc^i \mid n>0, i>0\}$
 - $L_2 = \{aba^nb^jc^i \mid n>0, i>0, j>0\}$
 - b) $L_1 = \{a^n b^n c^i c \mid n > 0, i > 0\}$
 - $L_2 = \{a^j a^n b^i c^i \mid n > 0, i > 0, j > 0\}$
 - c) $L_1 = \{a^n b^j c^i c \mid n > 0, i > 0, j > 0\}$ $L_2 = \{a^j a^n b^i c^i \mid n > 0, i > 0, j > 0\}$
 - d) $L_1 = \{aca^nb^jc^ic \mid n>0, i>0, j>0\}$
 - $L_2 = \{aca^j a^n b^i c^i \mid n > 0, i > 0, j > 0\}$

Answer submitted: b)

You have answered the question correctly.

7. Programming languages are often described using an extended form of context-free grammar, where curly brackets are used to denote a construct that can repeat 0, 1, 2, or any number of times. For example, A → B{C}D says that an A can be replaced by a B and a D, with any number of C's (including 0) between them. This notation does not allow us to describe anything but context-free languages, since an extended production can always be replaced by several conventional productions.

Suppose a grammar has the extended production:

A → BC{DE}F

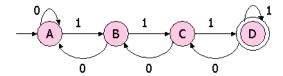

Convert this extended production to conventional productions. Identify, from the list below, the conventional productions that are equivalent to the extended production above.

- $\begin{array}{ccccc} a) & \text{A} \to \text{BCA}_1F \\ & \text{A}_1 \to \text{A}_1\text{DE} & | & \epsilon \end{array}$
- b) $A \rightarrow BCA_1F$
- $A_1 \rightarrow DE \mid \epsilon$
- c) $A \rightarrow BCDEA_1F$ $A_1 \rightarrow DEA_1 \mid \epsilon$

Answer submitted: a)

You have answered the question correctly.

8. Examine the following DFA:

This DFA accepts a certain language L. In this problem we shall consider certain other languages that are defined by their tails, that is, languages of the form (0+1)*w, for some particular string w of 0's and 1's. Call this language L(w). Depending on w, L(w) may be contained in L, disjoint from L, or neither contained nor disjoint from L (i.e., some strings of the form xw are in L and others are not).

Your problem is to find a way to classify w into one of these three cases. Then, use your knowledge to classify the following languages:

- 1. L(1111001), i.e., the language of regular expression (0+1)*1111001.
- 2. L(11011), i.e., the language of regular expression (0+1)*11011.
- 3. L(110101), i.e., the language of regular expression (0+1)*110101.
- 4. L(00011101), i.e., the language of regular expression (0+1)*00011101.
- a) L(00011101) is disjoint from L.
- b) L(110101) is disjoint from L.
- c) L(110101) is neither disjoint from L nor contained in L.
- d) L(00011101) is neither disjoint from L nor contained in L.

Answer submitted: c)

You have answered the question correctly.

9. A nondeterministic Turing machine *M* with start state q₀ and accepting state q_f has the following transition function:

δ(q,a)	0	1	В
\mathbf{q}_0	$\{(q_1,0,R)\}$	$\{(q_1,0,R)\}$	$\{(q_1,0,R)\}$
\mathbf{q}_1	$\{(q_1,1,R), (q_2,0,L)\}$	$\{(q_1,1,R), (q_2,1,L)\}$	$\{(q_1,1,R), (q_2,B,L)\}$
\mathbf{q}_2	$\{(q_f,0,R)\}$	$\{(q_2,1,L)\}$	{}
$\mathbf{q_f}$	{}	{}	{}

Simulate all sequences of 5 moves, starting from initial ID q_01010 . Find, in the list below, one of the ID's reachable from the initial ID in EXACTLY 5 moves.

- a) 01111q₁
- b) 0111q₁
- c) 01q210
- d) 00101q₁

Answer submitted: a)

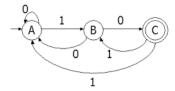

You have answered the question correctly.

- 10. Identify in the list below a sentence of length 6 that is generated by the grammar S \rightarrow (S)S | ϵ
 - a))((())
 - b) ()))((
 - c) ((()))
 - d)))(()(

Answer submitted: c)

You have answered the question correctly.

11. When we convert an automaton to a regular expression, we need to build expressions for the labels along paths from one state to another state that do not go through certain other states. Below is a nondeterministic finite automaton with three states. For each of the six orders of the three states, find regular expressions that give the set of labels along all paths from the first state to the second state that never go through the third state.

Then identify one of these expressions from the list of choices below.

- a) 0 represents the paths from B to C that do not go through A.
- b) 0+010 represents the paths from B to C that do not go through A.
- c) 1+101 represents the paths from C to B that do not go through A.
- d) (01)*0 represents the paths from B to C that do not go through A.

Answer submitted: d)

You have answered the question correctly.

- 12. In this question you are asked to consider the truth or falsehood of six equivalences for regular expressions. If the equivalence is true, you must also identify the law from which it follows. In each case the statement R = S is conventional shorthand for "L(R) = L(S)." The six proposed equivalences are:
 - 1. 0*1* = 1*0*
 - 2. $01\phi = \phi$
 - 3. $\varepsilon 01 = 01$
 - 4. (0* + 1*)0 = 0*0 + 1*0
 - 5. (0*1)0* = 0*(10*)
 - 6. 01+01=01

Identify the correct statement from the list below.

Note: we use φ for the empty set, because the correct symbol is not recognized by Internet Explorer.

- a) $\varepsilon 01 = 01$ follows from the identity law for concatenation.
- b) 01+01 = 01 is false.
- c) (0*1)0* = 0*(10*) follows from the idempotent law for union.
- d) (0* + 1*)0 = 0*0 + 1*0 follows from the associative law for concatenation.

Answer submitted: a)

You have answered the question correctly.

- 13. Design the minimum-state DFA that accepts all and only the strings of 0's and 1's that end in 010. To verify that you have designed the correct automaton, we will ask you to identify the true statement in a list of choices. These choices will involve:
 - 1. The number of *loops* (transitions from a state to itself).
 - 2. The number of transitions into a state (including loops) on input 1.
 - 3. The number of transitions into a state (including loops) on input 0.

Count the number of transitions into each of your states ("in-transitions") on input 1 and also on input 0. Count the number of loops on input 1 and on input 0. Then, find the true statement in the following list

- a) There is one state that has two in-transitions on input 1.
- b) There are two states that have no in-transitions on input 0.
- c) There is one state that has no in-transitions on input 0.

d) There is one state that has three in-transitions on input 1.

Answer submitted: b)

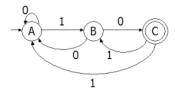

You have answered the question correctly.

- 14. h is a homomorphism from the alphabet $\{a,b,c\}$ to $\{0,1\}$. If h(a) = 01, h(b) = 0, and h(c) = 10, which of the following strings is in $h^{-1}(010010)$?
 - a) cbab
 - b) abba
 - c) bcbc
 - d) bcba

Answer submitted: c)

You have answered the question correctly.

15. Convert the following nondeterministic finite automaton:

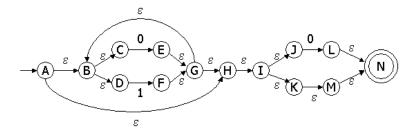

to a DFA, including the dead state, if necessary. Which of the following sets of NFA states is **not** a state of the DFA that is accessible from the start state of the DFA?

- a) {A}
- b) {}
- c) {B}
- d) {B,C}

Answer submitted: d)

You have answered the question correctly.

16. Here is an epsilon-NFA:

Suppose we construct an equivalent DFA by the construction of Section 2.5.5 (p. 77). That is, start with the epsilon-closure of the start state A. For each set of states S we construct (which becomes one state of the DFA), look at the transitions from this set of states on input symbol 0. See where those transitions lead, and take the union of the epsilon-closures of all the states reached on 0. This set of states becomes a state of the DFA. Do the same for the transitions out of S on input 1. When we have found all the sets of epsilon-NFA states that are constructed in this way, we have the DFA and its transitions.

Carry out this construction of a DFA, and identify one of the states of this DFA (as a subset of the epsilon-NFA's states) from the list below.

- a) BCDEGHIJKMN
- b) BCDFGHIJKMN
- c) LN
- d) BCDEGHIJK

Answer submitted: b)

You have answered the question correctly.

17. Here is a grammar, whose variables and terminals are NOT named using the usual convention. Any of *R* through *Z* could be either a variable or terminal; it is your job to figure out which is which, and which could be the start symbol.

We do have an important clue: There are no useless productions in this grammar; that is, each production is used in some derivation of some terminal string from the start symbol. Your job is to figure out which letters definitely represent variables, which definitely represent terminals, which could represent either a terminal or a nonterminal, and which could be the start symbol. Remember that the usual convention, which might imply that all these letters stand for either terminals or variables, does not apply here.

- a) V must be a terminal.
- b) T could be a variable or a terminal.
- c) T must be a variable.
- d) Y could be a variable or a terminal.

Answer submitted: c)

You have answered the question correctly.

18. If we convert the context-free grammar G:

to a pushdown automaton that accepts L(G) by empty stack, using the construction of Section 6.3.1, which of the following would be a rule of the PDA?

- a) $\delta(q,1,A) = \{(q,B), (q,\epsilon)\}$
- b) $\delta(q,\epsilon,A) = \{(q,A0), (q,1B), (q,1)\}$
- c) $\delta(q, \varepsilon, S) = \{(q, AS)\}$
- d) $\delta(q,\epsilon,B) = \{(q,0B), (q,0)\}$

Answer submitted: d)

You have answered the question correctly.

- 19. Which of the following strings is NOT in the Kleene closure of the language {011, 10, 110}?
 - a) 011011110
 - b) 10111011
 - c) 110011110
 - d) 1001110

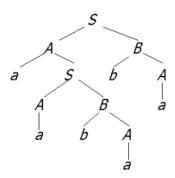

Answer submitted: b)

You have answered the question correctly.

20.	Consider the grammar G1: $S \to \epsilon$, $S \to aS$, $S \to aSbS$ and the language L that contains exactly those strings of a's and b's such that every prefix has at least as many a's as b's. We want to prove the claim: G1 generates all strings in L.				
	We take the following inductive hypothesis to prove the claim:				
	For n < k, G1 generates every string of length n in L.				
	To prove the inductive step we argue as follows:				
	"For each string w in L either (a1) or (a2) holds. In both cases we use the inductive hypothesis and one of the rules to show that string w can be generated by the grammar. In the first case we use rule $S \to aS$ and in the second case we use rule $S \to aSbS$."				
	Which phrases can replace the so that this argument is correct?				
	a) a1: there is a b in string w such that for the part of the string until the b (b also included) each prefix has as many a's as b's and for the part after b each prefix has as many a's as b's. a2: each prefix has more a's than b's.				
	b)	a1: each prefix has equal number of a's and b's. a2: there is a b in string w such that the part of the string until the b belongs in L by inductive hypothesis and the part after this b belongs in L by inductive hypothesis.			
	c)	a1: each prefix has equal number of b's and a's. a2: w can be written as w=aw'bw" where for both w' and w" it holds that each prefix has as many a's as b's.			
	d)	a1: each prefix has more a's than b's. a2: there is a b in string w such that the part of the string until the b (b also included) has all prefixes with as many a's as b's and the part after b is such that each prefix has as many a's as b's.			
	Ans	wer submitted: d)			
	You	have answered the question correctly.			
21.	21. The operation Perm(w), applied to a string w, is all strings that can be constructed by permuting the symbols of w in any order. For example, if w = 101, then Perm(w) is all strings with two 1's and one 0, i.e., Perm(w) = {101, 110, 011}. If L is a regular language, then Perm(L) is the union of Perm(w) taken over all w in L. For example, if L is the language L(0*1*), then Perm(L) is all strings of 0's and 1's, i.e., L((0+1)*).				
	If L is regular, Perm(L) is sometimes regular, sometimes context-free but not regular, and sometimes not even context-free. Consider each of the following regular expressions R below, and decide whether Perm(L(R)) is regular, context-free, or neither:				
	2. 3. 4. a) b) c) d)	(01)* 0*+1* (012)* (01+2)* Perm(L((012)*)) is not context-free. Perm(L((01+2)*)) is not context-free. Perm(L((012)*)) is regular. Perm(L(0*+1*)) is not context-free.			
		have answered the question correctly.			

B → bA.

22. The parse tree below represents a leftmost derivation according to the grammar $S \rightarrow AB$, $A \rightarrow aS \mid a$,

Which of the following is a left-sentential form in this derivation?

- a) aaSBB
- b) aSba
- c) aaABBB
- d) aaBB

Answer submitted: d)

You have answered the question correctly.

23. Consider the grammar G and the language L:

G: S
$$\rightarrow$$
 AB | a | abC, A \rightarrow b, C \rightarrow abC | c

L: {w | w a string of a's, b's, and c's with an equal number of a's and b's}.

Grammar G does not define language L. To prove, we use a string that either is produced by G and not contained in L or is contained in L but is not produced by G. Which string can be used to prove it?

- a) cacabbb
- b) abac
- c) abacccc
- d) aabb

Answer submitted: d)

You have answered the question correctly.

- **24.** The binary string 1001001 is a member of which of the following problems? Remember, a "problem" is a language whose strings represent the cases of a problem that have the answer "yes." In this question, you should assume that all languages are sets of binary strings interpreted as base-2 integers. The exception is the problem of finding *palindromes*, which are strings that are identical when reversed, like 0110110, regardless of their numerical value.
 - a) Is the given string a palindrome?
 - b) Is the given string a perfect cube?
 - c) Is the given string a composite number (not a prime)?
 - d) Is the given string a perfect square?

Answer submitted: a)

You have answered the question correctly.

25. Convert the grammar:

to an equivalent grammar with no unit productions, using the construction of Section 7.1.4 (p. 268). Then, choose one of the productions of the new grammar from the list below.

- a) $D \rightarrow D$
- b) $A \rightarrow 3$
- c) $S \rightarrow E$
- d) $S \rightarrow E1$

Answer submitted: a)

You have answered the question correctly.
